

# CRUD APPLICATION

For this application I am using CodeIgniter because it's a powerful PHP framework with a small footprint. It's built for developers who need a simple and elegant toolkit to create full-featured web applications.

For coding I am using html,javascript,CSS5,AJAX and JQuery since I am making a web based application.

For Database I am using MySQL and using local server to run it (XAMPP).

How to Run it.

1. Make sure you have XAMPP on your PC
2. Place the folder app on htdocs inside your XAMPP location file.
3. Create a database called tasks then import a file called task into it then it will load your 2 tables of the database (users and tasks).
4. Open your browser then type in this command <http://localhost/brighton//users> to access your users then you can add/delete/read/edit a user.
5. Open your browser then type in this command <http://localhost/brighton//Task> to access your tasks then you can add/delete/read/edit a task.
